

Business Requirements

GRADUATE RECRUITMENT PORTAL PROJECT

Business Requirements Documentation

Executive Summary

The executive summary will consist of a summary of the report's key points. Which will consist of the purpose of the project, the major points, and the recommendations for the project.

The purpose of the project:

The purpose of the project is to manufacture a graduate student portal for CPUT (Cape Peninsula University of Technology) that is a portal where students that have graduated from CPUT can send their CVs through CPUT to get a job in the student's line of study. The design of the portal is to make the recruitment officer's job easier and more convenient to send the student's CVs to the correct businesses. The portal will mainly be a WordPress application (Web-based application) and consist of different databases, these databases will break down into smaller, manageable databases for the recruitment officer to gain easy access to it.

The major points:

According to the recruitment officer (Bronwyn Abrahams), currently, the system is not feasibly for use, the reason being that the current system is more of an email and social media-based approach, which is not acceptable. The recruitment officer is asking us as students to develop a system that is a web-based application that consists of databases and a webpage for the graduates to send their CVs through.

The recommendations:

Where the recruitment officer can view the CVs and send the CVs to the correct businesses. Bronwyn also requested that the system would display to the user to please submit a pdf version of the CV and not a word document. Bronwyn also requested that the system should also send an email back to the user indicating that the CV was captured and that it is correct. The recruitment officer also requests that the system sorts the different CVs to the correct databases so that it is easier for the recruitment officer to disrupt the CVs to the correct businesses.

Project Objectives

In order for the Graduate Recruitment Portal system to be successfully built, our project team needed to identify the exact objectives of the business so we can determine what they want to achieve. To help with identifying those objectives, we made use of the SMART technique. The SMART model basically will require that the Graduate Recruitment Portal project be specific, measurable, achievable, relevant, and timely.

Specific (S)	• The specific goal of this project is to build a graduate recruitment portal system that enables the recruitment administrator to manage and keep track of CVs from recent graduates. • Another specific goal is to enable recent graduates to submit their CVs on to the graduate recruitment portal website. • Companies should be able to inquire about specific CVs on the website.
Measurable (M)	• To meet those mentioned specific goals, it should be measurable. • To reach these objectives, measurements will be put in place such as working according to the project plan. • Another way to measure the success of the Graduate Recruitment project will be to do system testing before deploying it into production. • Testing will ensure that the system does what it is supposed to do and meet business objectives and requirements.
Achievable (A)	• Managing CVs, submitting of CVs, inquiring of CVs → In order to make these goals achievable, the project team must each give their contribution when developing the system. • Another way to achieve these goals will be to work on the project on a daily basis to ensure problems and defects get fixed immediately.

	• In order to make these important goals achievable, each member should apply their programming skills and knowledge to the project.
Relevant (R)	• It is important that the goals are relevant to the project in order to meet the specific objectives. • While performing tasks which help with building the system, it is important that each of us share our tasks with other members, so they can evaluate our work and give inputs and suggestions on where we can improve, to ensure a 100% functional system gets delivered in the end.
Timely (T)	• To ensure that the system meets the business requirements, it is important that the project should be completed within time and within schedule. • The aim is to get this fully functional system done by midDecember, which is four months from now on. • To reach these goals, it is going to require some over-time during weekends, so that the client can get her working system on the promised time.

Project Scope

Project name

Graduate Recruitment Portal

Problem statement

The main purpose of this project is to create an automated system for CPUT recent graduates. It is to help connect graduates seeking professional skills to companies that are looking to help them gain these skills. This is made possible by the administrator. The system

must aim to help the administrator in such a way that the work done is all processed in through the automated system which will not be time-consuming like the manual system. The system must also allow the data being processed to flow in an efficient manner from all stakeholders. The system will also include basic functions entailing Create, Read, Update, and Delete. Where each user of the system will be able to create profiles and interact with the system with their designated authorized user rights.

Objectives

- Develop an automated system that manage and process recent graduates CVs
- Develop a system that enables the recruitment officer to advertise available positions
- Develop a system that enables graduates to submit their CVs for employment
- System should keep CV data confidential using the POPI act
- Companies should be able to request for CVs on the recruitment portal website

Milestones

Planning Basis

1.1 Milestones

A milestone is a major event in the project and represents the completion of a set of activities and includes:

- Project and resource planning
- Analyse and document current business processes
- Business Requirement documentation
- Functional Requirement documentation
- Conceptual Database design
- Database design
- Wireframe design
- User Interface design
- Implementation / Coding
- Testing
- Debug and retest
- User Acceptance testing
- Post Project Review

Key project milestones are listed and described in the following table:

Milestone	Description	Delivery Date
Project and resource planning	Delegation of tasks to team members based on their capacity, skill sets, and the best fit for the job	05/08/22
Analyse and document current business processes	process analysis or current state analysis is a process management strategy that identifies and evaluates a business's current processes.	12/08/22
Business Requirement documentation	document describes the business solution for a project (i.e., what a new or updated product should do), including the user's needs and expectations, the purpose behind this solution, and any high-level constraints that could impact a successful deployment.	12/08/22
Functional Requirement documentation	formal statement of the system's functional requirements. It serves the same purpose as a contract.	26/08/22
Conceptual Database design	the first stage in the database design process. The goal at this stage is to design a database that is independent of database software	02/09/22
Database design	the organization of data according to a database model.	09/09/22
Wireframe design	two-dimensional illustration of a page's interface that specifically focuses on space allocation and prioritization of content, functionalities available, and intended behaviours	16/09/22
User Interface design	focuses on anticipating what users might need to do and ensuring that the interface has elements that are easy to access	23/09/22
Implementation / Coding	Implementation of the classes	30/09/22
Testing	Unit and Integration testing	28/10/22

Stakeholders

Roles & Responsibilities of Internal stakeholders

Role	Responsibility
Project Supervisor	Our supervisor for this project is Ms Inderlal, her responsibility is to monitor the project team members (including the project team leader) progress for the duration of the project.
CPUT Client	Mrs Abrahams is our client for this project; her role is to approve the project plans, request adjustments, raise concerns and risks, approve milestones, and accept or refuse the project's final deliverables.
Students that have graduated	They are the people who will make use of the graduate recruitment portal once it has been released.
Project Leader	The project leader is responsible for leading the team and gives the team members instructions.
Project Team Members	Team members are responsible for carrying out duties and instructions assigned by the project team leader.

Roles and Responsibilities of External Stakeholders

Roles	Responsibility
Companies	The businesses will make CV requests and conduct their own independent recruitment.

SWOT Analysis

Strengths

Our team is rich in labour resources. There are more than enough resources to get the job done. The risks of being affected by someone leaving the team are small. Weaknesses

- Lack of workplace management.
- Lack of industry experience.

Opportunities

Left blank intentionally.

Threats

Left blank intentionally.

Functional Requirements

Functional Requirements

A functional requirement defines functions of a software. A function is described as a set of inputs, the behavior and outputs.

1. Student inputs System Registration information

- The system shall register the user
- The system shall store the user's data
- The system filters information that should be sent to the company
- The system generates information spreadsheet

2. Student/Admin inputs login details

- The system shall authenticate the information, if authorized the system will display a landing page.
- Else, they system will redirect the user to the login page

3. Student Inputs Demographics and CV

- The system shall validate the demographics
- The system will upload the document (CV) and store it

4. Student Requests open job

- The system shall display list of jobs.
- The system shall provide all jobs requirement before the user applies for that specific job type

5. Company requests Graduate

- The system shall get student information that is stored
- The system shall generate student information spreadsheet
- The spreadsheet with the student's demographics will be sent to the company

6. Student Submits Job Application

- The system shall send the application to the company

Non-functional requirements

A non-functional requirement is a requirement that specifies criteria that can be used to judge the operation of a system, rather than specific behaviours.

1. Usability

The system shall have a user-friendly interface with only needed features

- More than one type of user can use the system at a time, specifically the student and the admin can use the system at the same time.
- There is no need of training to use the system. A student who has basic computer knowledge can open the systems and add their information.
- The system shall protect users not to make any errors when filling in their details.

2. Performance

- The system shall accept a big size of data's especially when a user wants to upload documents like CV.
- The system shall generate the information spreadsheet in less time.

3. Reliability

- Users expect the system to be reliable which means Student's information registered yesterday in the system shall be there today
