

PFD TERM 1 TEST PREP

Definitions

A - The optimistic time for a node(activity)

B - The most likely time for a node (activity)

C - The worst case time for a node (activity)

MU - The time it takes to traverse the critical path (The path with no slack)

S - A value necessary for calculating Z, is determined by square root of S^2

S²- Equal to the sum of all variances along the critical path

Z - Used to determine the probability of completion at a point in time via a z-table (See Z Formula)

X - The term we use to describe the point in time we wish to examine when determining Z.
An example for a value for X would be time 14

Formulas

Expected Duration = $A + 4B + C/6$

Variance = $(C - A / 6)^2$

Z = $x - MU/S$

Calculating Probability of completion with Z

Z table lookup - Use the z value calculated to conduct a lookup in the z table
