

PROJECT 3: PRIVATE DOCTOR MANAGEMENT SYSTEM GROUP 10

TERM 2: INDIVIDUAL ASSIGNMENT

Name: Thabiso

Surname: Matsaba

Student Number:

220296006

Lecturer: Karin Swart

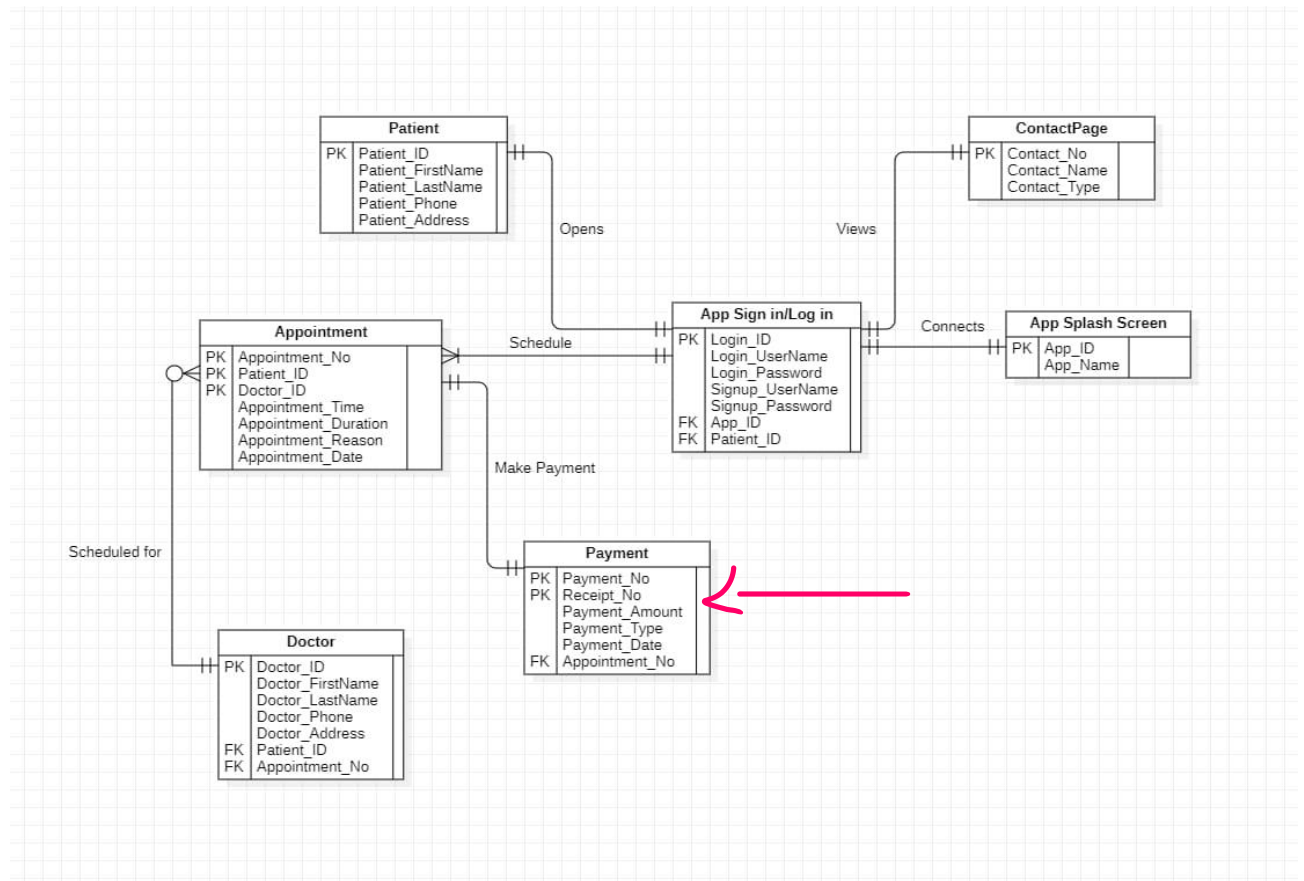

Due: 23 May 2022

Project 3

- **Project 3 Group 10 Private Doctor Application**

Throughout the year, my group members and I are developing a private doctor application for android devices.

- **Entity Relational Diagram(ERD)**

In our application, I have been tasked to code the Payment Entity Table. The payment table will address the appointment table in the ERD. When the user is done booking an appointment, the user will be redirected to the payment interface to pay for the appointment. The user will have a payment number, receipt number, payment amount, payment type(card, cash, zapper) and the payment date.

- Table name: **Payment**

Attributes: int Payment_No(PK)

int Reciept_No(PK)

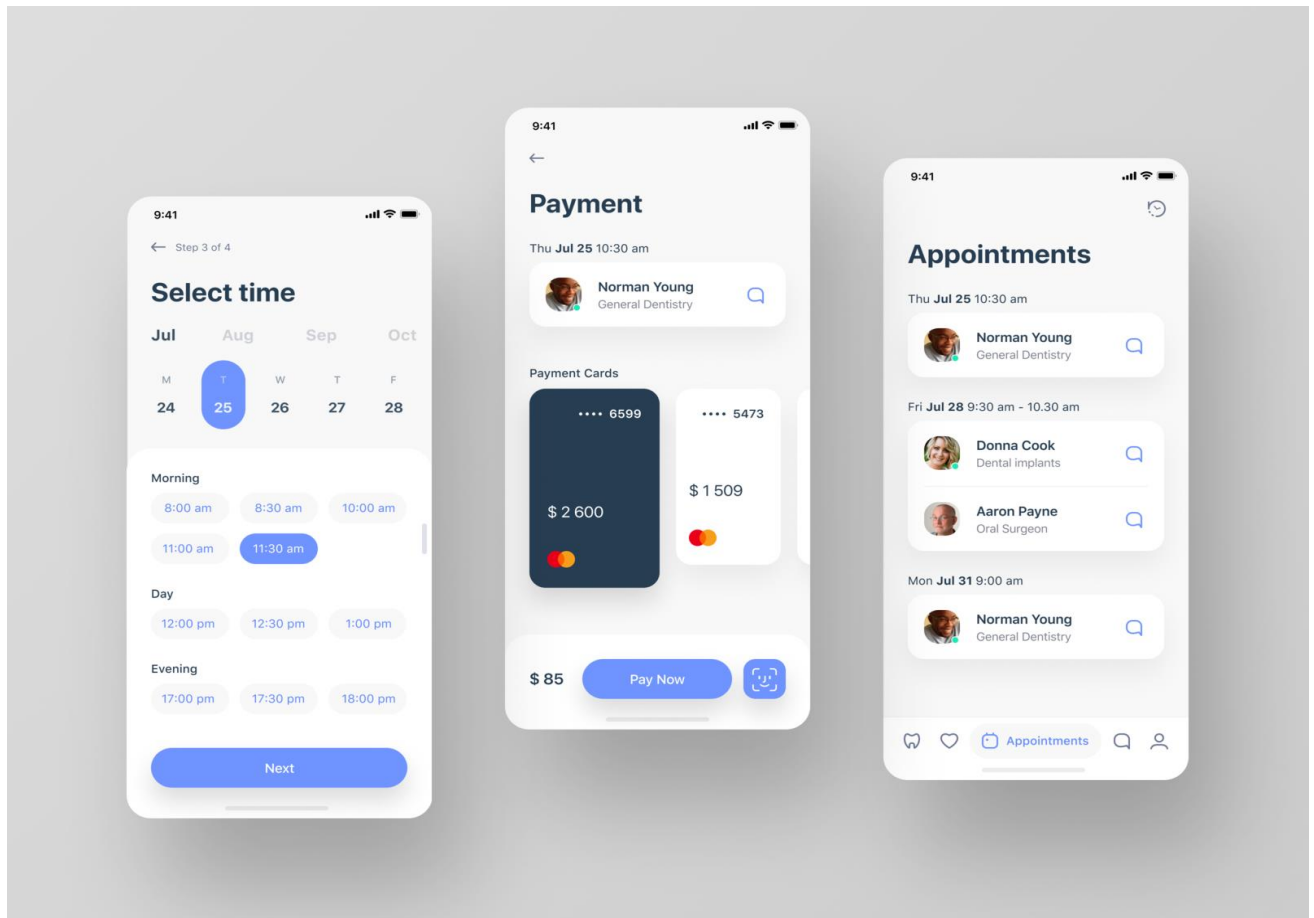

int Payment_Amount

String Payment_Type

Date Payment_Date

int Appointment_No(FK)

- **User Interface Design for Payment Entity**

- **Business Rules**

- Each Patient must create one User Account. Each User Account must be created by one patient.
- Each Patient can Schedule one Appointment with one Doctor. An appointment gets scheduled by one Patient with one Doctor.
- Each Doctor can have many appointments. Each Appointment can have only one Doctor.
- Each Patient can view one Contact Page. Each contact page gets viewed by one Patient.
- Each Patient makes one payment for. Each payment is received by one Patient.
- Each payment gets issued one receipt. Each receipt is issued from one payment.

- **Reflection**

Issues encountered and how I addressed them:

The main issue I encountered was testing the functionality of payments to make sure everything works as intended. To test my payment interface, I had to assure a purchase flow proceeds smoothly and provides positive user experience within the application, plus implement logic that covers all possible subscription-related scenarios. And lastly validate those transactions will behave properly once the app is released.

Skills acquired and lessons learned:

I used a lot of relevant and useful technologies while coding my part of the application. I was not familiar with the Android Studio Integrated Development Environment (IDE), I watched a lot of YouTube tutorials to teach myself how to use it. I also learnt a lot about user experience best practices and to code using business logic and rules.

- **GitHub**

We have created a GitHub repository, which we use to collaborate and share code among all team members. The link for my repository:
