

Context dataflow diagram – Graduate Recruitment Portal

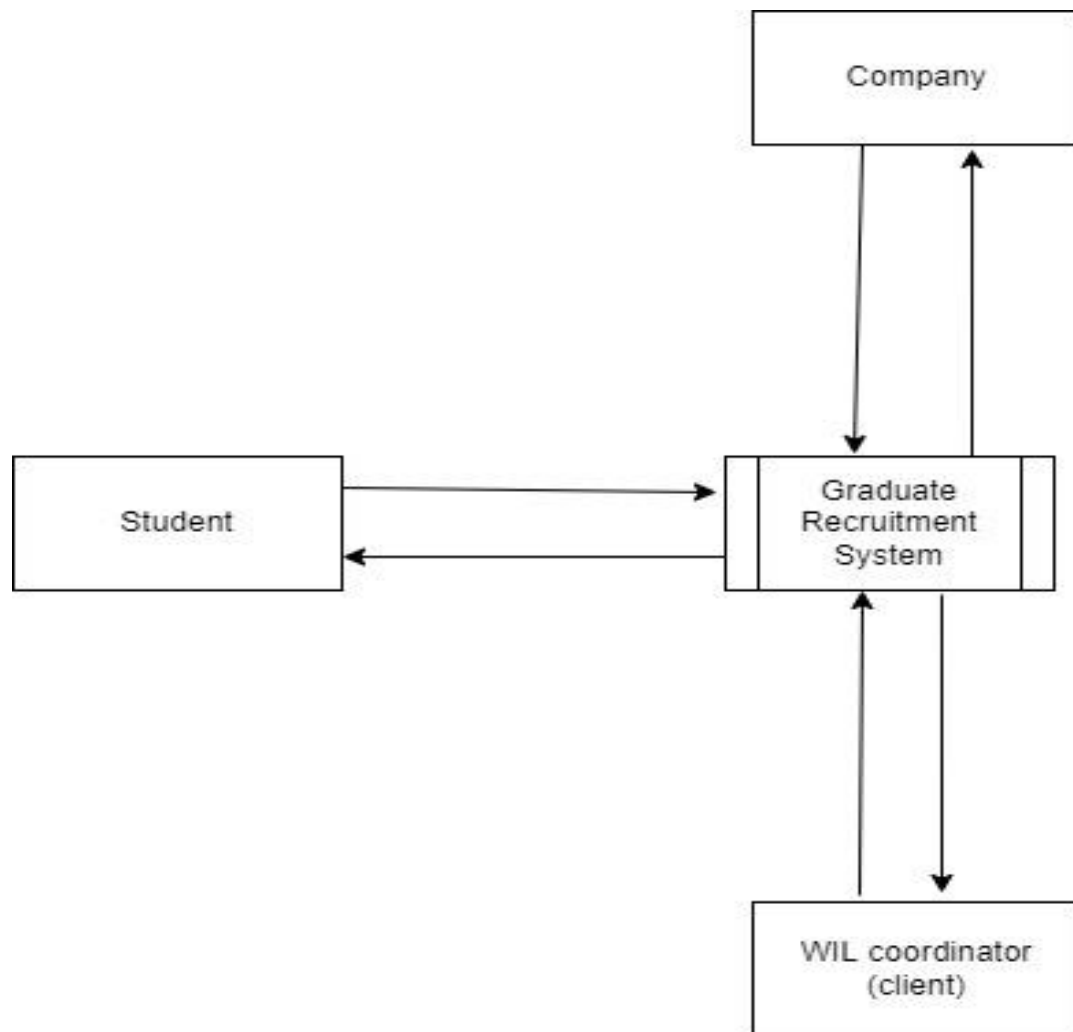

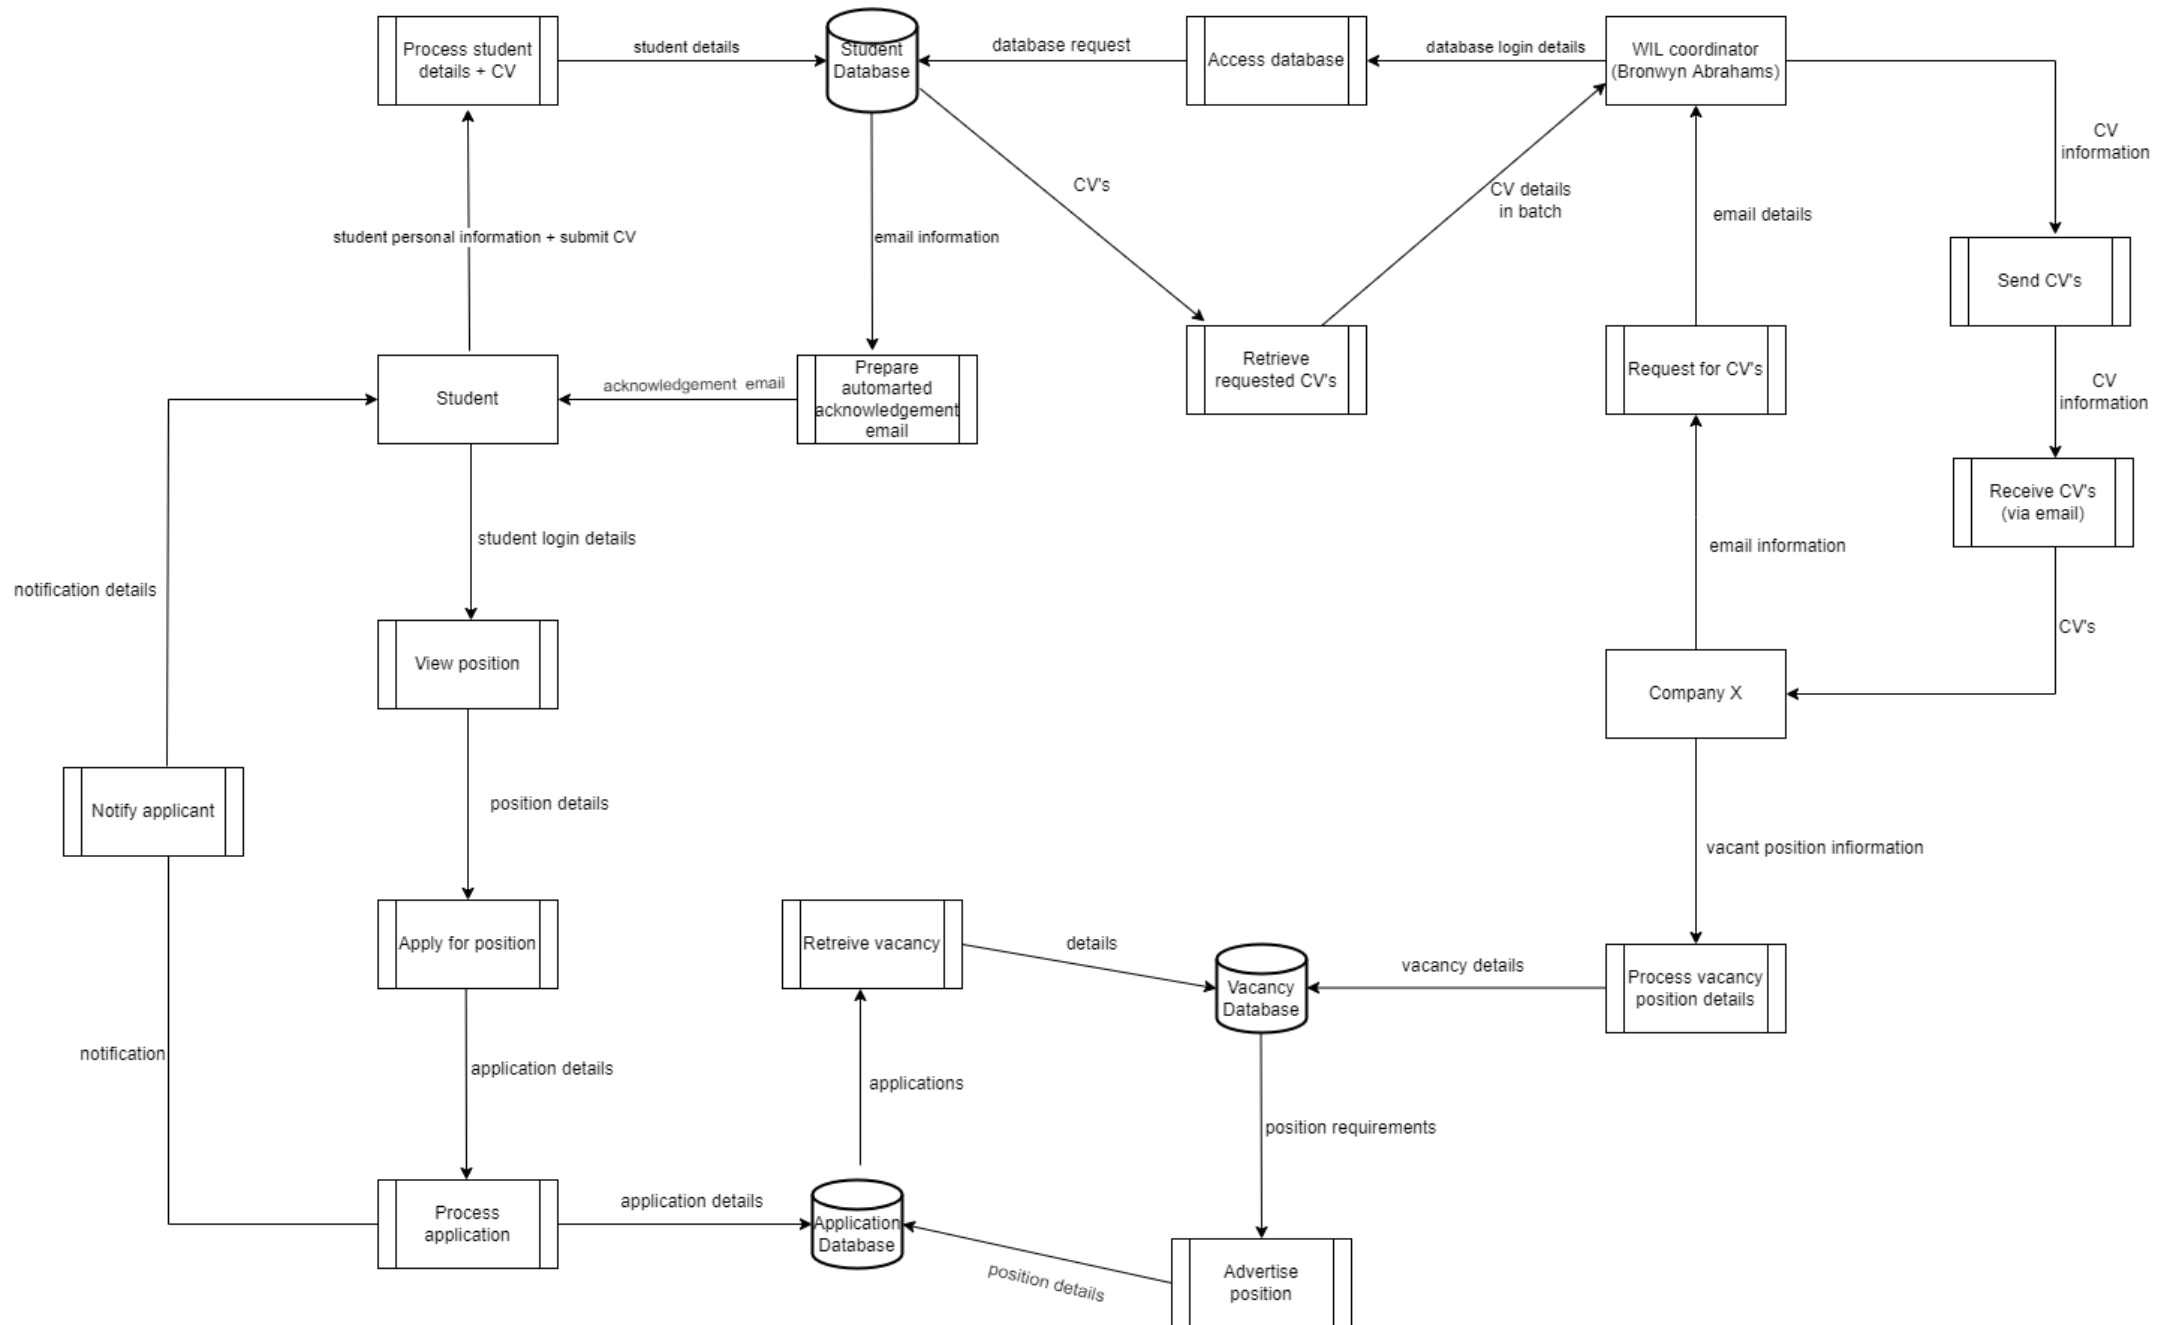

Figure 1: Context based dataflow diagram

The context-based dataflow diagram was the first diagram that was needed to be drawn first. This diagram basically shows the interaction between the different entities (student, WIL coordinator – Bronwyn Abrahams and the company) and the Graduate Recruitment Portal system. Each entity is indicated by a rectangles shape. Each arrow which moves both directions, indicates the flow of data/interaction. On the other hand, the system is placed in the center between the entities indicated by a rectangle with two vertical lines on the sides.

The level 1 dataflow diagram – Graduate Recruitment Portal (previous page)

1. The first step of the process starts with the student. On the Graduate Recruitment Portal website, the student will have to enter his or details first before they can submit their CV. Also, the CV will be attached after all necessary details has been entered.
2. The next step is where the details will be processed (indicated as a rectangle with two vertical lines).
3. After the student's details have been processed, the student data will be stored on to the database (database is indicated as a cylinder, with the name of the database in it).
4. Now, an automated email response is prepared, to let the student know that their CV has been acknowledged. The email, then should reach every student that submitted their CV on the Graduate Recruitment Portal website.
5. Once the student's details and CV is stored on the database, the WIL coordinator, Bronwyn Abrahams can access the database and retrieve those submitted CV's.
6. For her to retrieve CV's, she must enter her login credentials to get access to the database on the Graduate Recruitment Portal.
7. The database then retrieves those specific CV's depending on the user's needs.
8. If company X requests for CVs from Bronwyn, the steps from step 5 to 7 gets repeated.
9. Bronwyn responds to the company and send those specific requested CVs, i.e. CVs from HR students or CVs from Information Technology students.
10. The company should then receive those CV's in batches.
11. A company also has the option to advertise positions on the graduate recruitment portal website.
12. For the company to post the position, they must enter the position details on the website.
13. The position details get then processed and after processing, those details get stored on the "Vacancy database".
14. Once the position details are saved on the database, the position gets posted/advertised on the website.
15. Those positions are then stored on the application database as well.
16. A student can also apply for a position on the portal.
17. He or she enters their login credentials, in order to access the portal.
18. Then their can view available positions posted by a company.
19. They can then apply for the position they are interested in.
20. After the student applied, their application gets processed.

21. The student should then get automatically notified that their application was received.
22. Students will then be notified if their application was successful or not.
